Precious Metal Presentation

Precious metal thin films play a role in a variety of industrial fields. We provide high-purity sputtering targets and vapour deposition materials in shapes and sizes to suit every application.

We can supply the following precious metals:

GOLD

The most malleable of all metals, gold can be processed into fine wire or thin foil. With an extremely high infrared ray reflectivity of 98.4%, thin films of gold are used in the space shuttle to protect the crew from the infrared rays of the sun.

IRIDIUM

The increased hardness and anti-corrosion properties when alloyed with platinum and palladium have been applied to fountain pen nibs and balls for ball pens.

RHODIUM

Chemically stable, rhodium will dissolve gradually in aqua regia when in a powder form, but will not dissolve in acid or aqua regia when in a solid form. Rhodium plating plays a large role in searchlight reflectors and elsewhere performs a decorative function.

| Tensile strength 695 MPa | | |
| Elongation | 5% | |

RUTHENIUM

Hydrogen is formed through the breakdown of water by the sun's rays in a non-polluting hydrogen energy system that stores hydrogen as fuel. Hopes are rising that ruthenium will act as the essential catalyst to realize this future energy source.

SILVER

Silver is used in large quantities in the form of silver nitrate as a photographic sensitive material. This metal also has the most superior reflectivity of visible light rays of any metal. For this reason, silver is used in mirrors requiring high light reflection.
